FREELANCE DATA PREPARATION | DECEMBER 2024 - MARCH 2025

Preparing large healthcare datasets for ML

More than 1.5 TB of scattered source data prepared for a treatment-cost prediction engagement.

Inputs
Large, scattered files

→

Process
Python + Pandas

→

Scale
Azure resources

→

Prepare
Model-ready inputs

My contribution

Preprocessed the source data and used cloud resources for processing beyond local development capacity. The engagement focused on preparation for downstream modelling.

Illustrative cleaning example

Synthetic input: cost = "1,250.00" and an inconsistent date string. Illustrative output: numeric cost and a normalised date after explicit validation.

Public example boundary

The example is invented to explain data preparation. It does not reproduce patient rows, the client schema, or claim a particular measured cleaning or prediction result.

Healthcare data preparation engagement | December 2024 - March 2025 | Examples use synthetic records.
